A sound environment for meeting

The secret to a successful dining and meeting area is not always the cooking or the furnishings, it's also in the acoustics. The food and furnishings may be fabulous, but if people can't have a conversation over clattering dishes, scraping chairs, and the loud laughter at the next table, they'll likely be looking for another place. In today's design-oriented world, acoustical products need to do more than function. They need to complement, and if possible enhance interior spaces. That's why ArtUSA Industries designs solutions with the result clients are looking for. ArtUSA Industries affordable acoustic and

sound control solutions are the proven answers to help meeting and dining areas sound better and positively influence meeting, special events, and dining. Lightweight and easy to suspend from high, open ceilings using traditional hanging or innovative cable suspension systems baffles absorb sound from all directions to reduce reverberation in large interior spaces. Baffles are offered in a variety of standard and custom colors to complement or match color schemes. Fabric-wrapped wall panel absorbs up to 85% of the sound directed toward it. They are available in hundreds of fabrics to complement or match wall or ceiling. Ceiling tiles with a backer board drop into a standard grid system and help block sound traveling from adjacent rooms. Tiles without a backer board can be adhered to any wall or ceiling surface making them ideal for rooms without a grid system or those with low ceiling heights.
