

Religious Facilities

In churches, synagogues and worship centers large or small, words and music can sound incomprehensible to the congregation if sound is not properly controlled. Poor sound quality is common in churches because of an abundance of hard surface materials. Brick, marble, stone, tile, glass, wood and sheetrock

are all acoustically reflective. Sound waves bounce back and forth between parallel surfaces, creating a confusion of noise until they finally decay. Even the most strategically-placed speakers and microphones will not compensate for poor acoustics. Every room needs some absorptive materials and some reflective materials to get the right acoustic mix for the room's intended purpose. The

challenge is to find that balance. Art-Fab and Art-Sorb panels from ArtUSA Noise Control Products Inc. are designed to absorb airborne sound energy and reduce a room's overall noise, reverberation and standing waves—creating interiors that reduce the din without sacrificing the divine. The right balance between absorption and reflection using strategically placed acoustic wall panels and baffles, create a more enjoyable worship and listening experience. ArtUSA Industries affordable acoustic and sound control solutions are the proven answers to help the message and experience. Lightweight and easy to install wall and ceiling treatments reduce reverberation and absorb sound from all directions. Traditional and or innovative solutions noise control and sound quality issues are our mission.
